As noted in Part I, the 1990s were characterized by a shift away from traditional approaches to energy efficiency, such as building codes and standards, towards market-based approaches such as rebates, incentives, and tax credits. This shift was driven by a recognition that traditional approaches were not effective at achieving significant energy savings. The market-based approach, on the other hand, was seen as more efficient and cost-effective, as it allowed consumers to choose the most cost-effective energy efficiency measures for their specific needs.
